

Cable tray connection to mesh cable tray

AI Overview

Cable trays can be securely connected to mesh cable trays using couplers, bolts, or proprietary connector kits to ensure alignment, load support, and safe cable routing.

Connection Methods

Couplers and Splice Kits Standard cable trays and mesh cable trays can be joined using splice kits or couplers designed for the specific tray type. These kits allow for a secure, aligned connection and maintain structural integrity across the transition between tray types. Proprietary connector systems, such as Legrand's P31 automatic coupling, provide tool-less installation and quick alignment.

Bolted Connections For heavier cable loads or larger bundles, bolt sets are recommended. Position the ends of the cable tray and mesh tray together, align them carefully, and secure with bolts. This method ensures a rigid connection capable of supporting substantial cable weight.

Clip or Clamp Systems Some mesh trays allow clip-on connections where the tray ends are simply clipped together and tightened. This is suitable for lighter cable loads and allows for faster installation.

Installation Considerations

Alignment: Ensure both trays are perfectly aligned before tightening any connectors. Misalignment can cause uneven loads, sagging, or stress on the trays.

Support Placement: Place supports near the connection points, especially at bends or changes in elevation, to prevent deflection and maintain load capacity.

Load Ratings: Verify that the connection method and hardware comply with the tray's load rating. Couplers should be positioned according to manufacturer recommendations, often at 1/5th of the span for optimal performance.

Corrosion Protection: Consider the environment and select appropriate materials or coatings (galvanized, stainless steel, or aluminum) to prevent corrosion at the connection points.

Practical Tips Use pre-fitted coupling systems when available to reduce installation time and ensure compliance with standards. For long runs or high-density cabling, intermediate supports may be required to prevent sagging at the junction....
