

Construction of Hollow Cable Trays in Israel

AI Overview

Hollow cable trays in Israel are constructed using materials like galvanized steel, aluminum, or FRP, following strict technical standards for safety, load capacity, and environmental conditions. Materials and Types Hollow cable trays, often referred to as solid-bottom or ventilated trays, are designed to support and protect electrical and communication cables. Common materials include: Galvanized or painted steel for indoor applications, providing mechanical strength and corrosion resistance. Aluminum for lightweight, corrosion-resistant installations, suitable for industrial or offshore environments. Fiber Reinforced Plastic (FRP) for highly corrosive or non-metallic requirements. Tray types include ladder, perforated, solid-bottom, and wire mesh trays, with hollow designs typically used for solid-bottom or partially ventilated trays to protect cables from dust, moisture, or electromagnetic interference. Design and Installation Guidelines Construction and installation must comply with Israeli electrical codes (SI 1015) and international standards such as IEC-61537, UL 568, and NFPA 70. Key considerations include: Route Planning: Align trays with building structures, minimize detours, and separate power and signal cables to reduce interference. Load and Span: Select tray width and thickness based on cable weight and quantity, ensuring mechanical strength to prevent deformation. Supports and Mounting: Use wall brackets, trapeze hangers, or pedestal supports at intervals consistent with load ratings. Horizontal deviation should not exceed 2mm per meter, and vertical deviation 3mm per meter. Environmental Considerations: Outdoor or high-humidity areas require corrosion-resistant materials; trays must allow for heat dissipation and future cable expansion. Regulatory Compliance Israeli installations must adhere to electrical safety and fire codes, ensuring proper cable segregation, f...
