

Dominican Energy Internet

AI Overview

The Dominican Republic offers a developing energy system with growing renewable integration and reliable internet coverage, particularly in urban and tourist areas. **Energy Infrastructure** The Dominican Republic's electricity sector is managed through a combination of public and private entities, with companies like CEPM generating, transmitting, and distributing electricity to residential, commercial, and industrial customers, including 65% of the hotel sector . CEPM operates a smart grid that allows customers to monitor consumption in real time via apps and digital tools, supporting both prepaid and postpaid plans . The country's installed generation capacity connected to the National Interconnected Electric System (SENI) meets peak demand, which reached 3,923 MW in early 2025, with renewable generation contributing 1,554 MW . Despite sufficient capacity, occasional blackouts occur due to systemic issues and high technical and non-technical losses (34-39%) rather than lack of generation . The Dominican Republic is actively expanding renewable energy, including wind, solar, and hydro projects, aiming to reduce greenhouse gas emissions by one-third by 2030 compared to 2010 levels . Legislation and national energy plans, such as the National Energy Plan 2021-2036, guide the development of a more sustainable and reliable energy system . **Internet Infrastructure** Internet access in the Dominican Republic is available to approximately 85% of the population, with mobile internet speeds averaging 26 Mbps, sufficient for HD streaming and general digital use . Major providers like Claro and Altice cover both urban and many rural areas, though speed and stability can vary regionally . The country has seen improvements in fiber-optic and mobile networks, supporting digital media, VPN use, and streaming services . CEPM also contributes to internet connectivity by facilitating network access in schools, hospitals, and public security systems, integrating energy and digital services for enhanced monitoring and communication . **Practical Implications...**
