

Forced static electricity on optical fiber optic cable

Overview

Disruptions in connectivity: A buildup of static electricity on fiber optic end-faces can cause intermittent or complete disruptions in connectivity. This can lead to network downtime and negatively impact overall system performance. Static charges, also known as triboelectric charges, are the result of an imbalance in the distribution of electric charges on the surface of an object. When two objects come into contact and then separate, the redistribution of electrons can cause one object to become positively charged while the other becomes negatively charged. Electrostatic charge can interfere with light transmission, leading to signal degradation and, in severe cases, network failure. If so, your optical inspection at 200/400+ will detect it. There are several sources of contamination, but one of the most challenging to manage is dust. Proper cleaning tools and techniques can help ensure trouble-free connectivity.
