

Functions of Lighting Distribution Boxes in North Macedonia

AI Overview

Lighting distribution boxes in North Macedonia must comply with IEC standards, local legislation, and European harmonized directives, ensuring proper protection, earthing, and circuit coordination.

Regulatory Framework In North Macedonia, electrical installations, including lighting distribution boxes, are governed by national laws and by-laws administered by Elektro distribucija DOOEL, in alignment with international standards. Installations must also comply with European harmonized standards (EN) and IEC standards, which cover low-voltage electrical equipment, safety, and electromagnetic compatibility. The Low Voltage Directive applies to equipment rated from 50–1000 V AC and 75–1500 V DC, including lighting panels, circuit breakers, and protective devices.

Key Configuration Requirements

- Circuit Protection** Use Miniature Circuit Breakers (MCBs) for overload and short-circuit protection. Implement Residual Current Devices (RCDs) for protection against electric shock, coordinated according to load characteristics and earthing scheme (TT, TN, or IT) as per IEC 60364. Advanced protection may include Arc Fault Detection Devices (AFDDs) to prevent electrical fires.
- Earthing and Bonding** Proper earthing is mandatory to ensure safety and compliance with IEC and EN standards. The earthing scheme must be clearly defined in the distribution box, with all metallic parts bonded to the protective earth.
- Load Segregation** Lighting circuits should be separated from power circuits to prevent interference and allow selective protection. Each circuit should be labeled and sized according to expected load and conductor cross-section, following IEC guidelines.
- Enclosure and Accessibility** Distribution boxes must be housed in enclosures rated for the environment (IP rating for dust and moisture protection). Adequate space for wiring, future expansion, and maintenance access is...
