

Galvanized bolts for cable trays

AI Overview

Galvanized bolts, often paired with hex or flange nuts, provide durable, corrosion-resistant fastening for cable tray installations. Overview Galvanized bolts are commonly used for securing cable trays in both indoor and outdoor environments due to their high resistance to corrosion. The hot-dipped galvanization (HDG) process coats the steel bolts with a protective zinc layer, making them suitable for harsh weather conditions and industrial use. These bolts are typically paired with flange nuts or hex nuts, often with a fixed washer to prevent the nut from falling during installation. Common Types and Sizes M6 x 12mm or M6 x 20mm bolts: Standard sizes for cable tray and trunking applications, available in boxes of 100 for bulk use. Hex flange bolts: Designed for rapid and secure fixing, the flange distributes load and reduces the risk of loosening under vibration. Serrated flange nuts: Often used with these bolts to enhance grip and prevent rotation. Material and Finish Options Hot-Dipped Galvanized (HDG): Provides superior corrosion resistance for outdoor or industrial environments. Zinc-plated: Suitable for indoor applications with moderate exposure to moisture. Stainless steel (304): Offers excellent corrosion resistance and is ideal for highly corrosive environments. Aluminum: Lightweight option for specific applications. Installation Considerations Ensure the bolt length matches the tray thickness and any supporting brackets. Use a fixed washer or flange nut to prevent the nut from falling into the socket driver during installation. For outdoor installations, HDG bolts are preferred to withstand rain, temperature changes, and airborne pollutants. Summary Galvanized bolts with compatible nuts are a reliable and durable solution for cable tray fixing. Choosing the right size, material, and finish ensures secure, vibration-resistant fastening suitable for both internal and external installations, while minimizing maintenance and corrosion issues.
