

High-voltage power distribution main busbar

Overview

Busbars act as the main current highways inside high voltage switchboards, linking incoming feeders, outgoing circuits, and protective devices in a compact, safe structure. In electric power distribution, a busbar (also bus bar) is a metallic strip or bar, typically housed inside switchgear, panel boards, and busway enclosures for local high current power distribution, transmission, or switching substations. What controls it: High-voltage power systems form the backbone of the modern economy, ensuring the efficient and safe transmission of electricity from power plants to consumption areas. Good busbar design cuts losses, improves reliability, and supports flexible operation in systems like GGD Low Voltage. A complete power solution for transformer to main panel board connections. Vertiv™ PowerBar HPB is a 1000V totally encased, non-ventilated and low impedance busbar. HPB sandwich construction range has been engineered for applications which require moving large amounts of power.
