

How much does fiber optic cable scrap cost per ton

AI Overview

Fiber optic cable scrap is generally low in value, often ranging from \$200 to \$600 per ton depending on composition, purity, and regional market conditions.

Pricing Overview Fiber optic cables are primarily composed of glass fibers, polymers, and minimal metal components such as steel strength members or trace copper, which limits their scrap value compared to copper-only cables. Typical market rates for bulk fiber optic scrap are often quoted per meter or per kilometer rather than per ton, with examples including \$5–\$6.60 per meter for industrial-grade scrap or \$5.50 per kilometer for large-scale network rollouts. Small-scale or mixed scrap may fetch lower prices, sometimes only a few cents per piece.

Factors Affecting Scrap Value

- Material Composition:** Pure glass fiber scrap has minimal recoverable metal, reducing profitability, while hybrid cables with copper or aluminum components increase value.
- Condition and Cleanliness:** Well-maintained, uncontaminated cables yield higher returns. Mixed or dirty scrap requires additional processing, lowering net value.
- Volume and Logistics:** Large volumes allow economies of scale, whereas small batches may incur higher transportation and handling costs relative to scrap value.
- Regional Market Differences:** Prices vary by region due to recycling infrastructure, regulatory standards, and local demand. Asia-Pacific markets dominate in volume, while North America and Europe have stricter recycling programs but lower volumes.

Practical Considerations

- Recycling Process:** Fiber optic scrap must be separated from spools, packaging, and other telecom debris. Proper staging and containment improve efficiency and profitability.
- Economic Viability:** Because fiber optic scrap contains little metal, the cost of collection, transportation, and processing can sometimes outweigh the material value, especially for small-scale operations.
