

How to connect the wire terminals in the distribution box

AI Overview

To connect wire terminals in a distribution box, ensure the power is off, identify phase, neutral, and earth wires, and securely attach them to the corresponding terminals following the wiring diagram.

Safety First Before starting, cut off the main power supply and verify with an electrical tester that no electricity is present in the installation area. Wear insulating gloves, safety glasses, and slip-resistant shoes to prevent electric shock or injury. Ensure the distribution box is mounted securely and level, preferably in a dry, ventilated, and accessible location.

Step-by-Step Wiring Procedure

Identify Wires and Terminals

- Phase (Live) wire:** Usually brown or red, connects to the main terminal or input of the main MCB.
- Neutral wire:** Typically blue, connects to the neutral link or input of the RCCB.
- Earth wire:** Green/yellow, connects to the earth link or metallic body of the box for grounding.

Install Circuit Breakers

- Place the main MCB in the designated slot.
- Install RCCB (if used) and other single-pole (SP) or double-pole (DP) MCBs according to the load requirements.

Connect the output of the main MCB to the input of the RCCB, and then from the RCCB to the load MCBs.

Connect Incoming Power

- Attach the incoming live wire to the main terminal.
- Connect the neutral wire to the neutral bar and the earth wire to the earth bar.

Connect Outgoing Circuits

- For SP MCBs, connect only the phase wire to the breaker output; neutral and earth go to their respective links.
- For DP MCBs, connect both phase and neutral wires to the breaker output.

Ensure each wire is correctly marked and routed neatly to avoid tangling or contact with sharp edges.

Secure Connections

- Strip the wire insulation to the correct length.
- Crimp or tighten wires firmly to terminals to ensure good conductivity and no loose connections.
- Leave enough space for heat dissipation and avoid overcrowding the box.
