

How to install the fixing straps for the distribution box

AI Overview

Fixing straps secure a distribution box to studs or surfaces, ensuring proper alignment, stability, and code-compliant installation.

Step-by-Step Installation

- 1. Prepare the Installation Area**Ensure the power is completely turned off and verify with a tester. Select a dry, ventilated location away from flammable or corrosive materials. Mark the desired height and position for the distribution box, typically 1.5 meters above the ground for residential installations .
- 2. Select and Inspect the Fixing Straps**Use straps compatible with your box model, such as the TEBS1624, which works with stud spacing up to 25" and includes pre-marked centerlines for 16" and 24" spacing . Check that the straps and screws are undamaged and suitable for the installation surface.
- 3. Mark and Drill Mounting Points**Align the strap with the marked box position. Use the pre-punched holes or keyholes on the strap to mark screw locations on the wall or studs. Drill holes of appropriate size and insert expansion bolts if mounting on masonry or concrete .
- 4. Attach the Straps**Secure the strap to the wall or studs using screws or bolts through the keyholes. Ensure the strap is level and firmly fixed; the box should not tilt or wobble . If using multiple straps, maintain consistent spacing to evenly support the box.
- 5. Mount the Distribution Box**Place the box onto the fixed straps, aligning it with the strap's centerline. Insert screws through the strap into the box mounting points. Tighten screws securely while keeping the box level and stable .
- 6. Complete Wiring and Safety Checks**Strip wires and connect them to the appropriate terminals (line, neutral, ground) following color codes . Arrange wires neatly and secure with cable ties, leaving space for heat dissipation. Perform insulation resistance and continuity tests to ensure safe operation.
- 7. Final Inspection**Verify that the box is stable, level, and all connections are secure. Ensure...
