

How to read the red light on a fiber optic melting tray

Overview

The red pointer, also called visual fault locating meter or visual fault detector, sends red light to check whether the optical fiber has red light leak to locate the damage point of an optical fiber. Even beginners can spot bends, cracks, or bad splices without complex tools. This guide explains how VFL tools work and how to use them safely. For onsite. When it comes to testing fiber optic cables, a Visual Fault Locator (VFL) is an essential tool in your toolkit., optical fiber fault detector, optical fiber fault test pen) is a 650nm (± 20 nm) semiconductor laser as a light-emitting device, which emits stable red light through a constant current source drive, and connects with the optical interface into the optical fiber, so.

Article Content

Checking Whether the Optical Fiber Is Damaged Using the Red

You can directly see the position with red light leak by using the red pointer. For onsite observation, it can only be used for locating the damage point of an optical fiber in a short distance.

VHO-HMterm

With the Hot Melt connectors, you need the same tools you need for epoxy/polish or anaerobic/polish connectors, plus a special high temperature oven to melt the adhesive before the fiber is inserted.

RPEN-210 Visual Fault Locator Pen 10mW 650nm

The VFL tool helps either identifying a strand of fiber by checking the remote end for light or simply allow to notice if any fiber strand is interrupted (seeing the red light reflections).
