

How to remove fiber optic cables from the computer room

AI Overview

Fiber optic cables in a computer room are removed carefully by identifying active and abandoned lines, following safety protocols, and gently disconnecting connectors to prevent damage. Safety Precautions Before removing fiber optic cables, it is essential to power down connected equipment to eliminate the risk of laser exposure and electrical hazards. Technicians should wear eye protection and work in a clean, well-lit area to avoid contaminating the delicate glass fibers. Handling should be slow and controlled to prevent cracks or breaks in the fiber, which can permanently damage the cable or disrupt network performance. Identifying and Preparing Cables Technicians first survey the computer room to distinguish between active and abandoned cables. Active cables are tested and documented, while unused or outdated lines are labeled for removal. Abandoned cabling often accumulates over years and may include multiple generations of fiber, voice, and data lines. Proper identification prevents accidental disconnection of critical network connections. Disconnecting Fiber Optic Cables The removal process depends on the connector type (e.g., SC, SC/APC). The steps include: Remove power from connected devices to ensure safety. Gently disengage the connector by applying light pressure along the connector axis, avoiding twisting or lateral force. Cap exposed connectors immediately to prevent contamination and dust ingress. Inspect cables for damage and ensure no tension or torque is applied during extraction. For multiple fibers within a cable, each fiber is handled individually to maintain integrity and prevent signal loss. Professional Removal Practices In larger facilities, such as offices or data centers, specialized technicians often perform cable removal. They conduct a cabling audit, tone and test questionable lines, and document which cables are in use. Abandoned...
