

How to set the color of electrical cable trays

AI Overview

You can set the color of electrical cable trays in Revit by using Object Styles, View Filters, or material assignments, and in Navisworks by applying materials or selection set overrides. Using Object Styles in RevitGo to the Manage tab on the Ribbon and select Object Styles. Switch to the Model Objects tab and locate the Cable Tray category. Click the color box next to Cable Tray to open the color palette. Choose a new color or define a custom color using RGB or HEX values. Click OK or Apply to confirm changes. This will affect all cable trays in the project. Using View Filters in Revit Navigate to the View tab and select Visibility/Graphics (shortcut VG). Scroll to the Cable Tray category and ensure it is visible. Create a new filter under Filters and assign it to the cable tray elements you want to differentiate. Set the filter's surface pattern to Solid Fill and select the desired color. Apply the filter to the view to display cable trays in different colors based on type or parameter. Applying Materials Assign a material to the cable tray in Revit via Manage > Materials. In Navisworks, create a selection set for the cable tray and apply a material override to control its color. Navisworks recognizes materials rather than filters or system overrides, so this ensures the color displays correctly when exporting. Instance-Specific Coloring For individual cable trays, use the Paint tool in Revit to apply a specific color to selected elements without affecting the entire category. By combining Object Styles, View Filters, and material assignments, you can effectively manage and visually differentiate cable trays in your electrical design projects, ensuring clarity in both Revit and Navisworks views.
