

How to wire the electrical distribution boxes on the first and second floors

AI Overview

To wire distribution boxes on the first and second floors, use a main distribution board (MDB) to feed sub-distribution boards (SDBs) on each floor, connecting circuit breakers, neutral, and earth properly while following safety standards.

Overview of Distribution Boxes

Main Distribution Board (MDB): Receives incoming power from the utility or transformer and contains the main isolator (double pole MCB), residual current devices (RCDs), and main circuit breakers.

Sub Distribution Board (SDB): Located on each floor, it receives power from the MDB and distributes electricity to individual circuits on that floor.

Final Distribution Board (FDB): Optional, for specific high-load appliances or sub-circuits.

Step-by-Step Wiring Process

Power Off: Ensure the main supply is turned off before starting any wiring.

Mounting: Install the MDB in a dry, accessible location, typically around 1.5 meters above the floor. SDBs should be installed similarly on each floor.

Incoming Supply: Connect the phase (live) and neutral wires from the utility to the main MCB in the MDB.

RCD Installation: Install RCDs in the MDB to protect against earth faults and leakage currents.

Feeding SDBs: Run appropriately rated cables from the MDB to each SDB on the first and second floors. Use cable sizes according to the load requirements and local electrical codes.

Circuit Breakers: In each SDB, connect single-pole MCBs for individual circuits (lights, sockets, AC units) and double-pole MCBs for high-power appliances.

Neutral and Earth Bars: Connect all neutral wires to the neutral bus bar and all earth wires to the earth bus bar in each distribution box.

Labeling: Clearly label each circuit breaker to indicate the area or appliance it controls, e.g., "First Floor Lights" or "Second Floor AC".

Testing: Before powering on, perform visual inspections and use a multimeter to verify correct connections and absence of short circuits.
