

Incoming line relay protection is ineffective

Overview

When a system has too many radial lines protection using time delay overcurrent relay becomes impractical. This problem can be solved to an extent by using distance relays. The presence of tapped transformers on a line, or reactive compensation devices such as series capacitor banks or shunt reactors, also influences the choice of protection system, and. Core idea: Transmission line protection detects faults and trips the correct breakers so the faulted line section is removed without unnecessarily de-energizing healthy equipment. The relay is an electrical switch which operates depending upon the value of current through it. Distance relays uses voltage and current to calculate the. This technical report refers to the electrical protections of all 132kV switchgear. Protection selectivity is partly.
