

Low-energy consumption of communication sites for data center interconnection

Overview

Discover how energy efficient networking technologies like Mellanox switches can reduce data center power consumption by up to 40% while maintaining low latency. Learn about adaptive link rate modulation and SmartNIC offloading to build sustainable green data centers. This study reviews and uses existing literature and public data sources to estimate the energy consumption of data centres and telecommunication networks in the European Union (EU-27) in 2022. Data centres in the EU used an estimated 45–65 TWh of electricity in 2022 (1). We propose a. Warehouse-scale data center operators need much-higher-bandwidth intra-data center net-works (DCNs) to sustain the increase of network traffic due to cloud computing and other emerg-ing web applications.
