

Multimode and Single-mode Optical Cables for Communication

Overview

Multimode fiber optic cables are suitable for transmitting high-speed data. Although they can do the same job in some instances, the different construction methods make each of them better suited to certain tasks and budgets. Multimode fiber cables are the type of fiber cables that transmit data via their core of larger diameters. But not all fiber cables are created equal: multimode (MM) and single mode (SM) fibers are the two primary types, each engineered for specific use cases, from short-range data center connections to transcontinental telecom backbones. This guide breaks down their technical differences, performance. The fundamental difference between Single Mode (SMF) and Multimode (MMF) fiber is the core size and how light travels through it.
