

Potential risks associated with co-routing fiber optic cables

Overview

Avoid routing fiber optic cables directly alongside copper cables, as vibrations or weight from copper can stress fiber cables, increasing the risk of macrobending. Use separate trays, ladders, or conduits for fiber optics when possible. Fiber optic cables, with their delicate nature and light-carrying capabilities, require stringent safety protocols. Without proper. There are plenty of hazards to watch for when working on commercial and industrial networks. More often it's a lack of understanding of the real hazards of fiber optic cable that can be the most. Besides the usual safety issues for all construction, generally covered under OSHA rules in the US (OSHA 10 and 30), fiber optics adds concerns for eye safety, chemicals, sparks from fusion splicing, disposal of fiber shards and more, covered in Part 1.
