

Principle of Detector Spectrometer

Overview

Spectrometer detectors consist of a row of light sensitive pixels, each of which corresponds to a particular wavelength. Each pixel will generate an electrical signal of intensity proportional to how much light falls on it. An optical spectrometer, like the Ossila USB spectrometer, is the most common type. By analyzing how much light is absorbed at specific wavelengths, we can learn. Internal structure of a grating spectrometer: Light comes from left side and diffracts on the upper middle reflective grating. An optical spectrometer (spectrophotometer, spectrograph or spectroscopy) is an instrument. UV-Vis spectrophotometers are popular in labs for analytical testing because they provide almost instantaneous readings and have a potential wavelength range from the ultraviolet spectrum, to visible light. They are used for drug analysis, enzyme reactions, water quality testing and color.

Spectrometer

A spectrometer is a scientific instrument used to separate and measure spectral components of a physical phenomenon. Spectrometer is a broad term often used to describe instruments that measure a continuous variable of a phenomenon where the spectral components are somehow mixed.
