

The 300Mbps fiber optic router is causing slow internet speeds

Overview

The blog helps you know real causes, obsolete routers, throttling, congestion, interference, and offers solutions like upgrading equipment, switching to fiber option, and optimizing device usage for faster connectivity without headache. With upload and download speeds that often exceed 1,000 Megabits per second (Mbps), fiber optic internet has the capacity to provide a seamless online experience while powering all of your connected devices at once. So, when your fiber internet doesn't deliver, it can be a huge letdown. The modem/router provides the expected 300Mbps connection, but the PC does not. But what. High-Speed Data Transmission: Fiber optics provide significantly higher bandwidth than copper cables, enabling faster internet speeds. Long-Distance Communication: Due to low signal attenuation, fiber optics can transmit data over long distances without the need for repeaters. Outdated WiFi standards: WiFi 5 (802.11ac). Fortunately, most of these are pretty simple to troubleshoot, diagnose, and fix.
