

# The network cabinet is too wide

## Overview

The right Network Cabinet size is determined by three key factors: total rack units (U) required, equipment depth, and future expansion capacity. In most business environments, choosing a cabinet with at least 20–30% extra rack space prevents overcrowding and extends system. When evaluating a new rack-mount enclosure to house network equipment and/or servers, it is important to understand why the external widths of cabinets range from 20" - 32" and wider. Even some seasoned IT professionals can not fathom why the external width of two cabinets can vary by up to 1-foot. HomeNetworking is a place where anyone can ask for help with their home or small office network. No question is too small, but please be sure to read the rules before asking for help. We also welcome pretty much anything else related to small networks. Its more ghetto but most of our home labs are since most people are on budgets. Common sizes are 24", 36", 42", and 48".
